

**Assignment -2 Python**  
Programming

Team ID:PNT2022TMID53952

Assignment Date	24 September 2022
Student Name	Jeba Shalomie Immanuel
Student Roll Number	9507191035
Maximum Marks	2 Marks

Question-1:

Build a python code, Assume u get temperature and humidity values (generated with random function to a variable) and write a condition to continuously detect alarm in case of high temperature.

Solution:

```
import random
import time while(1):
    temp=random.randint(0,80) hum=random.randint(0,80) if(15<=temp<=30):
        #room temperature in degrees Celsius between
        15C - 30C print("Temperature is normal. Temperature =
        ",temp) elif(temp<15): print("Temperature
        is too low.
        Temperature = ",temp) elif(temp>30):
        print("Temperature is too high. Temperature = ",temp)
    if(30<=hum<=50): #humidity may percentage between 30% - 50%
        print("Humidity is normal. Humidity = ",hum)
    elif(hum<30): print("Very less humidity.
        Humidity = ",hum) elif(hum>50):
        print("Very high humidity. Humidity = ",hum)
```

print() time.sleep(2)

#It observe temperature every 2 seconds

SAMPLE INPUT AND OUTPUT :

The screenshot shows a Python IDE with a project named '2python'. The file 'Assignment\_2.py' is open, containing a script that uses the 'random' and 'time' modules to generate random temperature and humidity values and print them out. The script includes conditional checks for 'normal', 'too low', and 'too high' ranges for both variables, followed by a 2-second sleep in a loop.

```
1 import random
2 import time
3 while(1):
4     temp=random.randint(0,80)
5     hum=random.randint(0,80)
6     if(15<=temp<=30):           #room temperature in degrees Celsius between 15C - 30C
7         print("Temperature is normal. Temperature = ",temp)
8     elif(temp<15):
9         print("Temperature is too low. Temperature = ",temp)
10    elif(temp>30):
11        print("Temperature is too high. Temperature = ",temp)
12    if(30<=hum<=50):           #humidity may percentage between 30% - 50%
13        print("Humidity is normal. Humidity = ",hum)
14    elif(hum<30):
15        print("Very less humidity. Humidity = ",hum)
16    elif(hum>50):
17        print("Very high humidity. Humidity = ",hum)
18    print()
19    time.sleep(2)              #It observe temperature every 2 seconds
20 while(1)
```

The Run console shows the output of the script, displaying the generated temperature and humidity values and their corresponding status messages, repeated over several iterations.

```
